**Who We Are:**

Elcore GmbH, a German corporation based in Munich, manufactures CHP products based on innovative proprietary HTPEM fuel cell technology. Thanks to its integrated development and production strategy, Elcore can reach an advanced development pace, outstanding product performance and highly competitive cost structures. The company focuses on combined heat and power systems using natural gas for individual houses, apartment buildings or larger properties.

**What We Do:**

The Elcore 2400 CHP system covers the base load of power and heat in individual homes. Thus, families can save up to 50% on their electricity bill and generate warm water throughout the year. A traditional boiler copes with peak heat demand. As an add-on unit, the Elcore 2400 can be combined with any existing boiler and storage tank and integrates seamlessly into the existing power and heat infrastructure.

**Our role in ene.field project:**

“Already by the end of this decade, Fuel Cell CHP systems are going to play a major role in our homes. Thanks to the ene.field project, European citizens will gain more knowledge on the technology and reach a higher confidence level in the products” said Dr. Manfred Stefener, Elcore CEO. Ene.field also enables the necessary synergy to promote the technology among the governments and energy organizations across Europe and ensure an optimal support for its broad implementation.
